Wherever your surveying takes place: with Kern, you always know where you stand.

How you get to this island is your problem. But once you're there, we can give you an accurate position on the spot: $Y = 348615.188$, $X = 329010.543$, $Z = 15.368$; it takes only seconds.

The name of the surveying system which gives you coordinates and lets you set out points of all types directly in the field is **SICORD**. It handles the entire data flow from the physical location to the office data base. Various programs process the measurements and eliminate virtually all "cleaning up" of field data when you're back at headquarters. You can leave all surveying and setting out calculations in the field to **SICORD**. It takes account of temperature, earth's curvature, refraction and reduction factors as well.

Before you run off to survey your dream island, why don't you fill out the information coupon? It's worth the trouble.

**New: SICORD-Programs
now with ALPHACORD.**
