In the case that k is an ordered field results similar to the Hilbert K -Nullstellensatz were proved by Dubois [2] and Risler [7]. To state their results we introduce the following notation:

Assume that k is an ordered field. Given an ideal I in R we let

$$I_D = \left\{ f \in R \mid \text{there exists an integer } m, \text{ positive elements } a_1, a_2, \dots, a_m \text{ of } k \text{ and rational functions } u_1, u_2, \dots, u_m \text{ in } k(x_1, x_2, \dots, x_r) \text{ such that } f^n \left(1 + \sum_{i=1}^m a_i u_i^2 \right) \in I \right\} \text{ and}$$

$$I_R = \left\{ f \in R \mid \text{there are positive elements } a_2, a_3, \dots, a_m \text{ of } k \text{ and elements } f_2, f_3, \dots, f_m \text{ of } R \text{ such that } f^2 + \sum_{i=2}^m a_i f_i^2 \in I \right\}.$$

It is fairly easy to see that I_R and I_D are radical ideals and clearly $I_R \subseteq I_D$. The Hilbert Nullstellensatz of Risler [7] states that, if $k = K = R_k$ where we denote by R_k the real closure of k , then

$$I_R = \{ f \in R \mid Z_K(f) \cong Z_K(I) \}$$

and the Nullstellensatz of Dubois [2] that, if $K = R_k$, then

$$I_D = \{ f \in R \mid Z_K(f) \cong Z_K(I) \}.$$

In particular it follows from these results that in the above cases I_R or I_D are equal to the K -radical $\sqrt[K]{I}$. From our point of view it is more satisfactory to proceed in the opposite direction and first prove directly, in the above cases, that the ideals I_D or I_R are equal to the K -radical and thus obtain the results of Dubois and Risler as a consequence of our K -Nullstellensatz. This can be done, however in order to prove that the various ideals are equal we need to use S. Lang's [6] version of Hilbert Nullstellensatz for real closed fields or Artin's solution of Hilbert's 17th problem (see [6], § 3 in particular Theorem 5 and Corollary 2 p. 279), so that this procedure is too close to the methods of Dubois and Risler to merit a separate presentation here.

§ 5. TWO EXAMPLES

In the introduction we associated to each ideal I of R a subset I_T of R such that $I \subseteq I_T \subseteq \sqrt[K]{I}$. For the two pairs of fields $k = K = \mathbf{Z}/2\mathbf{Z} = GF(2)$ and $k = K = \mathbf{Q}$ we give, in this section, examples of ideals I such that we have a strict inclusion $I_T \subset \sqrt[K]{I}$.

Example 1. Let k be the field with two elements and let $K = k$. Consider the ideal $I = (x_1) \subseteq k[x_1, x_2] = R$. The following three assertions hold:

(i) We have that

$$Z_K(I) = \{(0, 0), (0, 1)\} \subseteq \mathbf{A}_K^2 \text{ and} \\ \{f \in R \mid f \text{ vanishes on } Z_K(I)\} = (x_1, x_2(x_2 + 1)).$$

(ii) $\sqrt[K]{I} = (x_1, x_2(x_2 + 1))$.

(iii) $I_T = (x_1) = I$.

In particular we have a strict inequality $I_T \subset \sqrt[K]{I}$.

Of the three assertions (i) is obvious and the second follows from (i) and the Hilbert K -Nullstellensatz. To prove assertion (iii) we let $p \in P_K^0(m)$ and f_1, f_2, \dots, f_m be elements in R such that $p(f_1, f_2, \dots, f_m) \in I$. We shall prove that $f_i \in I$ for $i = 1, 2, \dots, m$. Assume to the contrary that not all the f_i are in I . Then the polynomials $f_i(0, x_2)$ are not all identically zero. Let d be the non-negative integer such that

$$f_i(0, x_2) = x_2^d g_i(x_2) \quad \text{for } i = 1, 2, \dots, m$$

and x_2 does not divide $g_j(x_2)$ for some index j . Since $p(f_1, f_2, \dots, f_m) \in I$ we have that

$$p(f_1(0, x_2), f_2(0, x_2), \dots, f_m(0, x_2)) = x_2^{de} p(g_1(x_2), g_2(x_2), \dots, g_m(x_2))$$

is identically zero in $k[x_2]$, where e is the degree of p . Hence

$$p(g_1(x_2), g_2(x_2), \dots, g_m(x_2))$$

is identically zero. In particular we have that $(g_1(0), g_2(0), \dots, g_m(0))$ is a zero of p in \mathbf{A}_K^m with $g_j(0) \neq 0$. This contradicts the assumption that $p \in P_K^0(m)$.

Example 2. Let $k = K = \mathbf{Q}$ and let $R = k[x_1, x_2, x_3]$. Moreover, let

$$f(y_1, y_2, y_3) = y_1^3 + y_2^3 + 3y_3^3$$

and $I = (f(y_1, y_2, y_3))$ the ideal in R generated by f .

The following three assertions hold:

(i) We have that $Z_K(I) = \{(a, -a, 0) \mid a \in K\} \subseteq \mathbf{A}_K^3$ and

$$\{f \in R \mid f \text{ vanishes on } Z_K(I)\} = (x_1 + x_2, x_3).$$

(ii) $\sqrt[K]{I} = (x_1 + x_2, x_3)$.

(iii) The ideal I_T does not contain a (non-zero) linear form.

In particular we have a strict inequality $I_T \subset \sqrt[K]{I}$.

The first assertion of (i) is a well known result in number theory (see e.g. Hardy and Wright [3], Theorem 232 page 196) and the second assertion of (i) is an immediate consequence of the first. Assertion (ii) follows from (i) and the Hilbert K -Nullstellensatz.

To prove assertion (iii) we let $l = ax_1 + bx_2 + cx_3$ be a non-zero linear form and $p = p(y_1, y_2, \dots, y_m) \in P_K^0(m)$ an element of degree d . Assume that there are polynomials $f_i = f_i(x_1, x_2, x_3)$ of R for $i = 1, 2, \dots, m - 1$ such that

$$p(f_1, f_2, \dots, f_{m-1}, l) = f(x_1, x_2, x_3) g(x_1, x_2, x_3)$$

for some polynomial $g = g(x_1, x_2, x_3)$. Then the following six assertions hold:

(a) *The polynomials f_1, f_2, \dots, f_{m-1} have zero constant term.*

Indeed, specialize x_1, x_2, x_3 to $0, 0, 0$ respectively. We obtain that

$$p(f_1(0, 0, 0), f_2(0, 0, 0), \dots, f_{m-1}(0, 0, 0), 0) = f(0, 0, 0) g(0, 0, 0) = 0.$$

Hence the existence of a non-zero constant term would contradict the assumption that $p \in P_K^0(m)$.

Denote by $l_i = l_i(x_1, x_2, x_3)$ the linear term of f_i .

(b) *The homogenous polynomial $p(l_1, l_2, \dots, l_{m-1}, l)$ is not (identically) zero and it is the lowest non-zero homogeneous term of*

$$p(f_1, f_2, \dots, f_{m-1}, l).$$

Indeed, if $p(l_1, l_2, \dots, l_{m-1}, l)$ were zero, we can specialize (x_1, x_2, x_3) to a point (a_1, b_1, c_1) of K^3 which is not a zero of l . We then obtain $p(l_1(a_1, b_1, c_1), l_2(a_1, b_1, c_1), \dots, l_{m-1}(a_1, b_1, c_1), l(a_1, b_1, c_1)) = 0$ which again contradicts the assumption that $p \in P_K^0(m)$. The second assertion of (b) follows from (a).

Denote by $h(x_1, x_2, x_3)$ the non-zero homogenous term of $g(x_1, x_2, x_3)$ which has lowest degree.

(c) *We have that $h(x_1, x_2, x_3)$ is of degree $d - 3$ and that*

$$p(l_1, l_2, \dots, l_{m-1}, l) = f(x_1, x_2, x_3) h(x_1, x_2, x_3).$$

Indeed, since f is homogeneous of degree 3, assertion (c) follows from assertion (b).

We write $l_i = a_i x_1 + b_i x_2 + c_i x_3$ for $i = 1, 2, \dots, m - 1$.

(d) *We have that $a = b$ and that $a_i = b_i$ for $i = 1, 2, \dots, m - 1$.*

Indeed, specialize x_1, x_2, x_3 to $1, -1, 0$ respectively. From assertion (c) we obtain that

$$p(a_1 - b_1, a_2 - b_2, \dots, a_{m-1} - b_{m-1}, a - b) = f(1, -1, 0) h(1, -1, 0) = 0.$$

Hence assertion (d) follows from the assumption that $p \in P_K^0(m)$.

(e) *We have that $a = b = a_i = b_i = 0$ for $i = 1, 2, \dots, m - 1$.*

Indeed, specializing x_1, x_2, x_3 to $x_1, x_2, 0$ respectively, we obtain from the equation of assertion (c) and from assertion (d) that

$$\begin{aligned} p(a_1(x_1 + x_2), a_2(x_1 + x_2), \dots, a_{m-1}(x_1 + x_2), a(x_1 + x_2)) \\ = (x_1^3 + x_2^3) h(x_1, x_2, 0). \end{aligned}$$

The left hand side of the latter equation is equal to

$$(x_1 + x_2)^d p(a_1, a_2, \dots, a_{m-1}, a)$$

which is not divisible by $x_1^3 + x_2^3$ unless $p(a_1, a_2, \dots, a_{m-1}, a) = 0$. Assertion (e) therefore follows from assertion (d) and the assumption that $p \in P_K^0(m)$.

(f) *We have that $c \neq 0$ and $p(c_1, c_2, \dots, c_{m-1}, c) = 0$.*

Indeed, since $l = ax_1 + bx_2 + cx_3$ is non-zero it follows from assertion (e) that $c \neq 0$. Moreover it follows from assertion (e) that the equation of assertion (c) can be written as

$$p(c_1x_3, c_2x_3, \dots, c_{m-1}x_3, cx_3) = f(x_1, x_2, x_3) h(x_1, x_2, x_3).$$

The left hand side of the latter equation is equal to $x_3^d p(c_1, c_2, \dots, c_{m-1}, c)$ which is not divisible by $f(x_1, x_2, x_3)$ unless $p(c_1, c_2, \dots, c_{m-1}, c) = 0$.

We have thus proved that, if we assume that polynomials f_1, f_2, \dots, f_{m-1} such that $p(f_1, f_2, \dots, f_{m-1}, l) \in I$ exist, we arrive at the contradiction (f) to the assumption that $p \in P_K^0(m)$. Hence we must have that $l \notin I_T$ as asserted.
