DYNAMIC LANDSCAPE | HYDROGONY

Hailiang Gong and Ioanna Antoniadi

site plan showing both projects

Dynamic landscape

The design concept seeks to use the energy of site to create an entirely new landscape rather than resorting solely to engineered intervention. The design breaks the dike of the Old Rhine and the water is allowed to make new paths that naturally build up small structures from materials of the site and further slow and accumulate sedimentation. Two distinct zones are gradually formed: one acts as a central park working at the scale of the whole Rhine Delta while the other is dedicated to waterside urbanism, both of which take advantage of locational assets and meet increasing demands for housing and tourism infrastructure. The design highlights the varying water levels of the lake and river in order to reveal the dynamic of landscape through the language of ecology and the passing of time.

Hydrogony

On a programmatic level, this project suggests a new route for the Rhine through the site. The western edge of the river is followed by a promenade starting from the existing Rhine and ending in a pier on the lake. The route's section changes along its length, allowing for different experiences of the water. The water's edge ultimately limits the urban growth of Hoechst by acting as an orientation tool for urban settlement while providing a clear connection to the lake. In the middle of this new path the river widens. Here, in the spatial but also gravitational center of the site, an island emerges. Walls are erected that act as sediment traps, continuing to collect the material that is washed down from the Alps. Planted with trees and an orchard on its raised center, the island can be explored via a footpath along its perimeter.
